# Introduction of tuberculosis

## Infectious diseases

Tuberculosis (TB) is one of the most common infectious diseases with approximately 9.9 million cases globally. Its most frequent presentation is pulmonary TB, nevertheless; **10–20% of TB infections are extrapulmonary**.

## Treatment

Almost half of patients are treated empirically with anti-tuberculosis drugs upon clinical suspicion only. Precise diagnosis is vital, as **different treatment approaches depend on the diagnosis**.

# Applications of ultrasound in extrapulmonary tuberculosis

## ➤ Ultrasound is a useful tool to detect signs of extrapulmonary tuberculosis

01

### Septations

Pleural tuberculosis; Primary mediastinal lymph node tuberculosis;  
Pericardial tuberculosis

02

### Superficial Organs & Soft Tissues

Thyroid tuberculosis; Cervical lymph node tuberculosis; Breast tuberculosis;  
Soft tissue tumors infected with mycobacterium tuberculosis

03

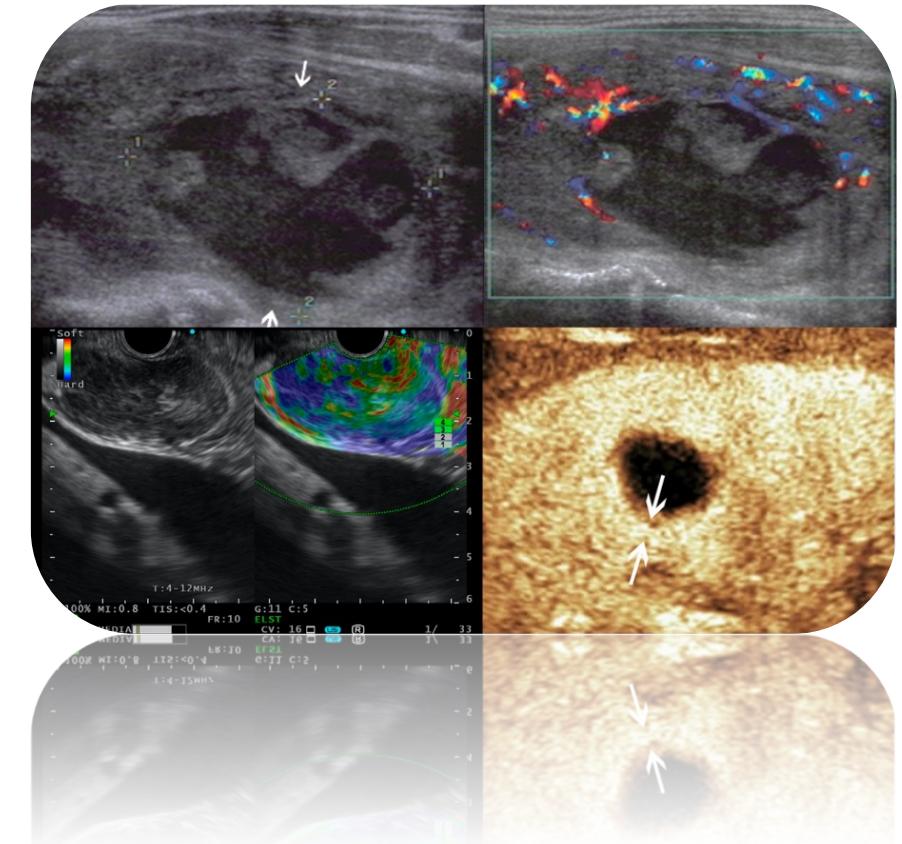

### Abdomen

Esophageal tuberculosis; Gastric tuberculosis; Intestinal tuberculosis;  
Pancreatic and peripancreatic tuberculosis; Hepatosplenic tuberculosis;  
Biliary tuberculosis; Peritoneal tuberculosis

04

### Genitourinary Systems

Renal tuberculosis; Ureteral tuberculosis; Prostate tuberculosis;  
Tuberous vas deferens tuberculosis; Female genital tuberculosis

# Septations

# Pleural tuberculosis

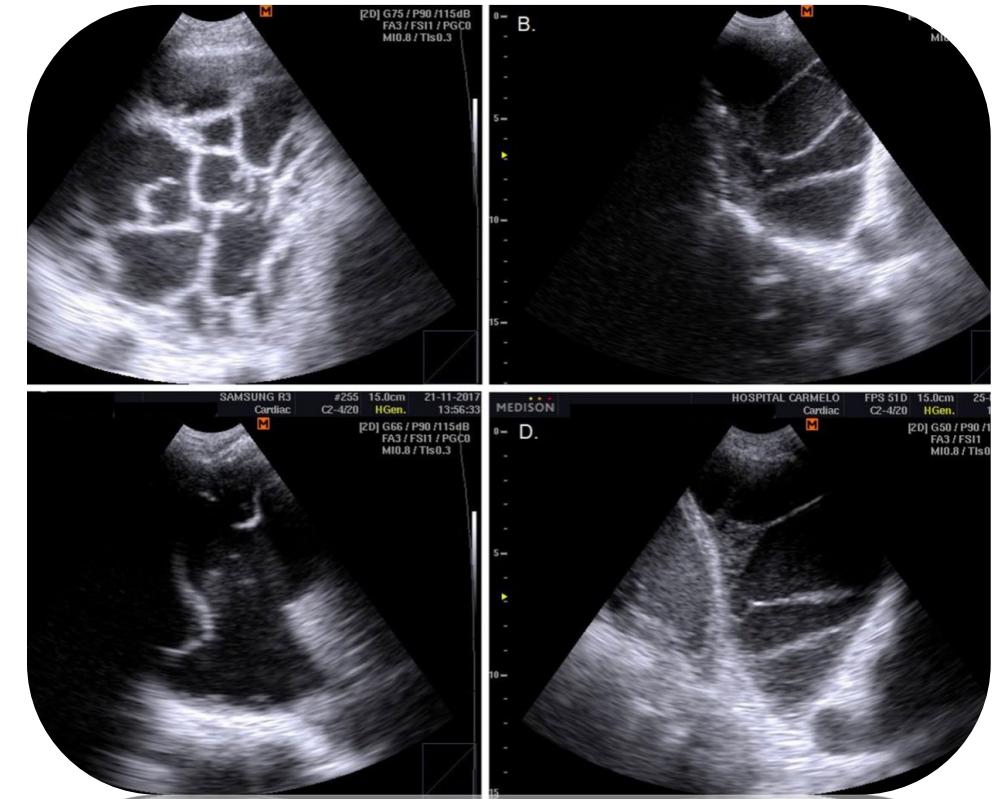

- Pleural TB is the most common manifestation of extrapulmonary tuberculosis.

## Holistic diagnostic approach

- Patients' signs and symptoms
- Risk factors (immunocompromised state and residents of high-burden countries)
- Tuberculin skin test
- Relevant radiological
- Laboratory investigations

## Ultrasound features

- Pleural thickening adjoining a complex pleural effusion.
- Multiple thin septations and fibrinous strands in the pleural space, producing a weblike or branching appearance.

# Primary mediastinal lymph node tuberculosis

- Tuberculosis bacilli can enter the bloodstream and attack other organs, including the lymphatic system.
- One manifestation associated with lymphatic tuberculosis infiltration is the presence of **large hilar and mediastinal lymph nodes**.

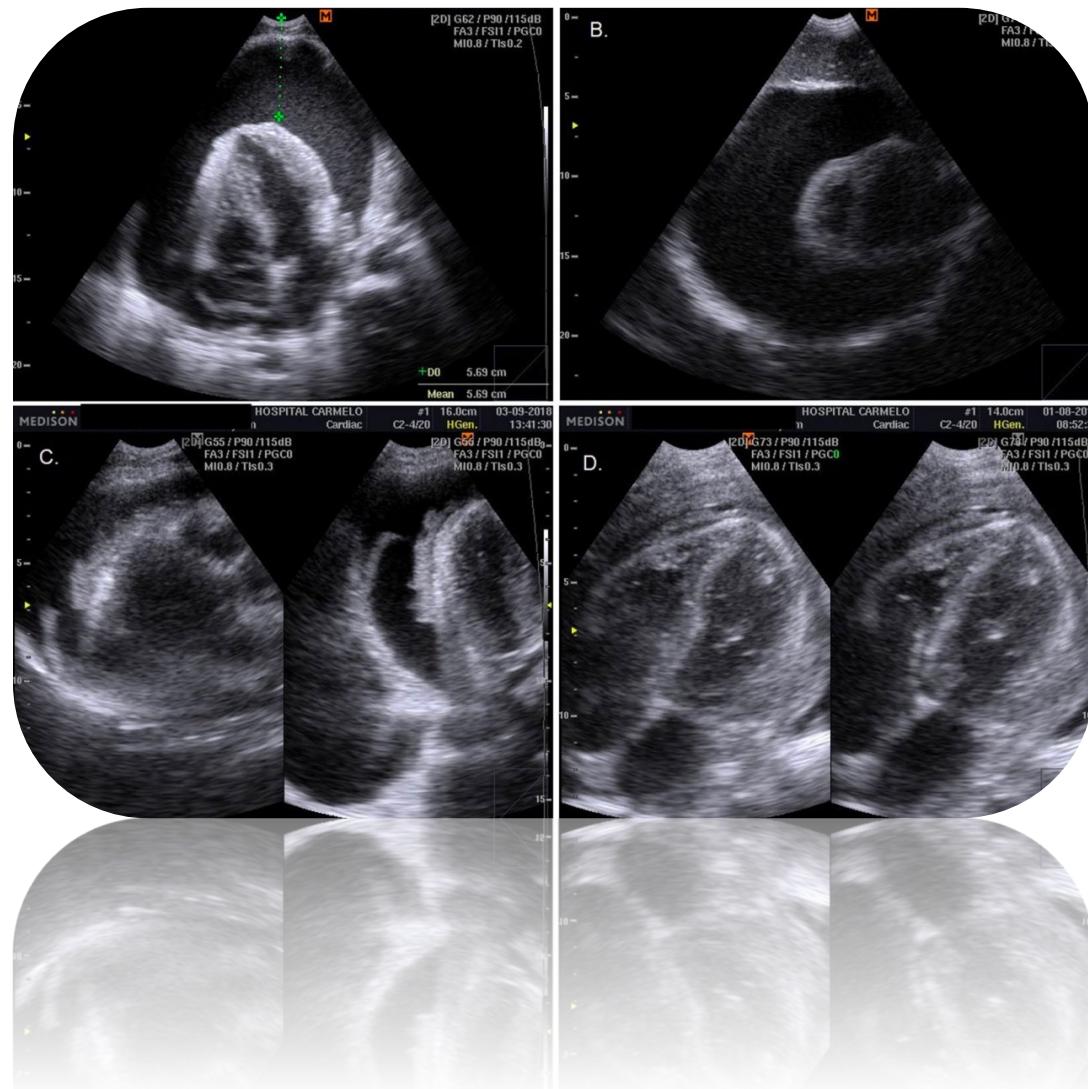

- **It is essential to emphasize the role of biopsy** of large mediastinal lymph nodes for suspected TB cases allowing for earlier definitive diagnoses.

# Pericardial tuberculosis

## Diagnosis:

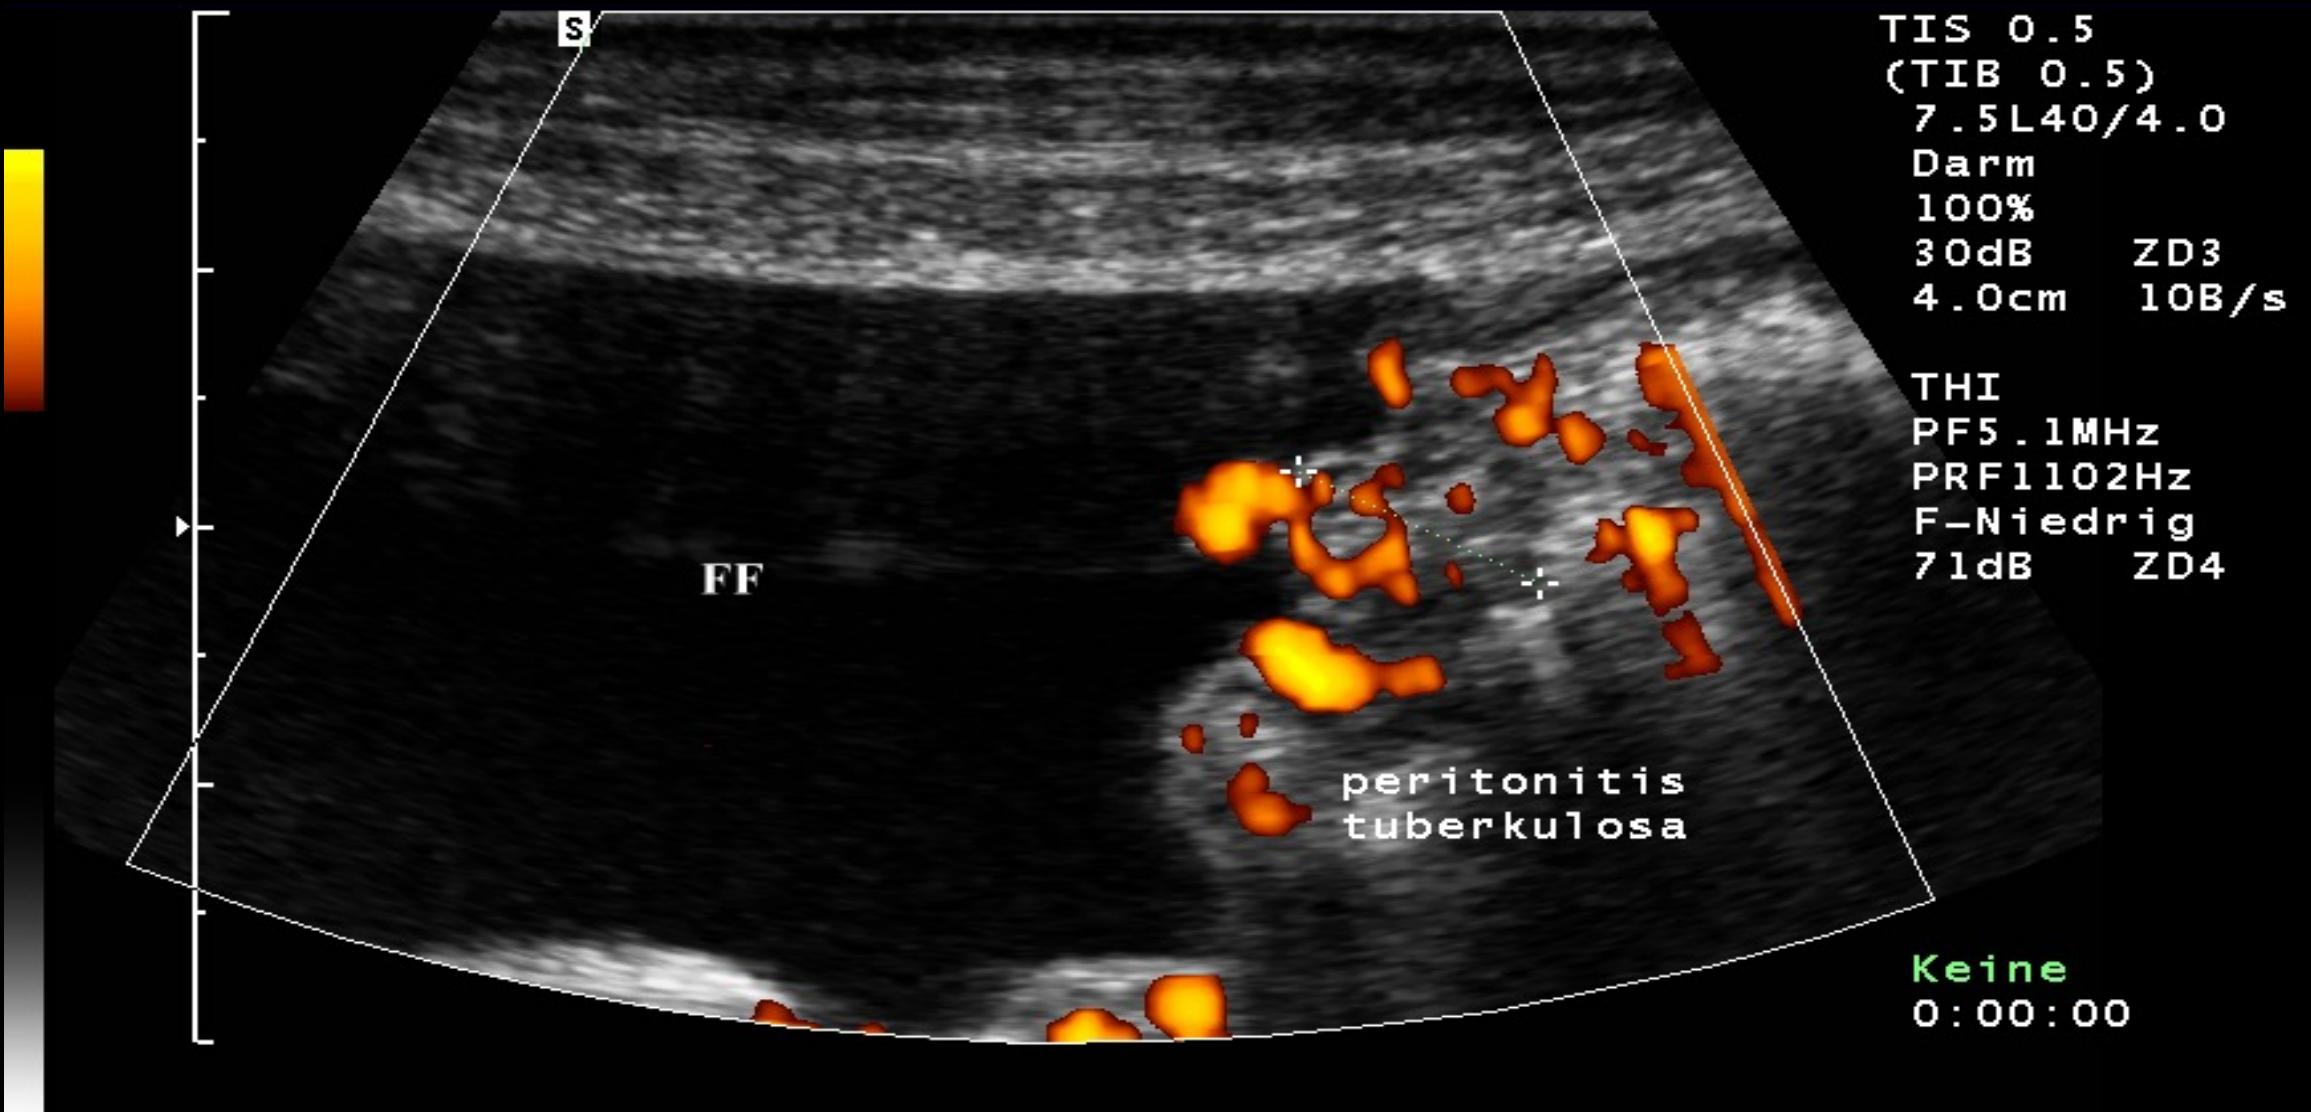

- Based on pericardial effusions with fibrinous filaments
- Pericardial thickening
- Complications (cardiac tamponade or impaired diastolic function, indicating pericardial constriction)

**Peritoneal (Omentum) / Pleural**

... we might be familiar with peritoneal and pleural tuberculosis ...

“White bowel – die weiße Darmwand”. Sonographischer Ausdruck einer mesenterialen Lymphstauung?

Ultraschall Med 2005;26:127-132

A close-up photograph of a kidney specimen. The kidney is a light brown, bean-shaped organ, oriented vertically. It is placed in a clear plastic tray, which is resting on a white surface. The tray has some faint markings or text on its side, though they are not clearly legible. The lighting highlights the texture of the kidney's surface.
